

# MORPHOLOGICAL OPERATIONS

# Set Theory:

- Deals with the properties of sets
- Examples are subset, union, intersection, complement and etc.
- For more information of these properties you may visit Mam Jing's pdf.

[https://uvle.upd.edu.ph/pluginfile.php/506366/mod\\_resource/content/1/A8-%20Morphological%20operation%202019.pdf](https://uvle.upd.edu.ph/pluginfile.php/506366/mod_resource/content/1/A8-%20Morphological%20operation%202019.pdf)

# Morphology:

- Changes the image via Set Theory
- We will discuss 2 morphological operations: Dilations and Erosion
- Morphology is also dependent with the use a “structuring element” to change an image.
- Structuring element is a basis on how morphology is performed. It is usually binary (or logical)

# Dilation

- Let  $z$  be the set of all points in the space and  $A$  is a subset of  $z$  while  $B$  is a structuring element.
- The Dilation of  $A$  by  $B$  of a pixel is true if and only if their intersection is not an empty set.

The Dilation of  $A$  and  $B$  by the structuring element is 1 since their intersection is not empty while it is 0 for  $C$  because their intersection is an empty set.

# Erosion

- Let  $z$  be the set of all points in the space and  $A$  is a subset of  $z$  while  $B$  is a structuring element.
- The Erosion of  $A$  by  $B$  of a pixel is true if and only if  $A$  fits  $B$  perfectly or  $A$  and  $B$  are identical.

The Erosion of  $A$  by the structuring element is 1 since it is identical to the structuring element while it is 0 for B and C because they are not identical to the structuring element.

# Hand drawn

- Using my knowledge on how Dilation and Erosion works, I used my pen and graphing paper to predict the Dilation and Erosion of 4 different figures with, 5 different structuring elements.

Figures (4):

- 1.) 5x5 square
- 2.) 10x10 square with 2x2 hollow
- 3.) cross with 5 pixel long ends
- 4.) 4x3 triangle

Structuring elements(5):

- 1.) 2x2 square
- 2.) 1x2 tile
- 3.) 2x1 tile
- 4.) cross with 1 pixel long ends
- 5.) a diagonal in a 2x2 matrix

# MATE JASON P. BUNAGAN - SHAPES

① 5x5 square

② hole with new hollow

③ cross

④ my weird A

Dilating Using: A

Erode Using: B

Just a line

# General Observation

- Dilation: More blocks are added. (hence the name)
- Erosion: Blocks are subtracted (hence also the name)
- I had initial errors in graphing especially the erosion of 2x1 and 1x2 of the cross because I forgot that it is impossible to have a structuring element in those places.
- The morphology is certainly dependent on the operation, figure and structuring element used.

# Coded Results:

- I also coded what the morphologies look like to confirm my hand drawn predictions.
- The plot used was a 2D histogram from scilab because since it looks very small when you save it as an image. (Blurred when enlarged)

# Original Figures (left) and Structuring elements (right):

# 1.) Dilation with Square (left) and Erosion with Square (right):

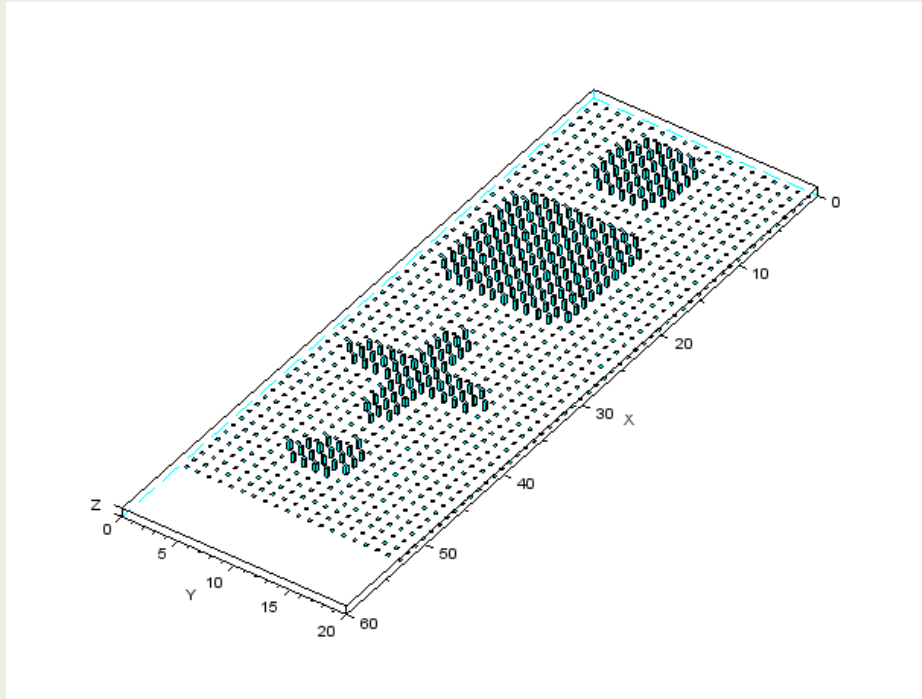

## 2.) Dilation with 1x2 (left) and Erosion with 1x2 (right):

# Dilation with 2x1 (left) and Erosion with 2x1 (right):

# Dilation with cross (left) and Erosion with cross (right):

# Dilation with diagonal (left) and Erosion with diagonal (right):

# How did I do:

- Got everything corrected including the ones that I corrected from the previous errors EXCEPT for one image.
- My hand drawn erosion of the square with hollow by a cross did not include the four corners of the hollow square. They are included because those places matches the structure element. My mistake!
